What if there was a better way to structure and optimise public health information systems so that they were patient-centred and enabled for real clinical insights?

HealthX brings together key building blocks to support a patient-centred clinical journey, ensuring that the right services are offered to patients when and where they are needed. It follows country-relevant standard treatment guidelines and clinical protocols across disease areas including preventative, community-based care.

The solution links existing systems to reduce fragmentation and improve connections between programmes and services, reducing loss to follow-up and retention in care.

Why HealthX?

In linking laboratory outputs, pharmacy information, ePrescribing and clinical care, HealthX enables clinicians, allied professionals and other healthcare workers to optimise patient care and gain operational efficiencies. A patient support module enables direct to patient engagement, as well as scheduling for reminders about upcoming visits, and treatment requirements.

HealthX enables clinicians, funders and other healthcare actors to work together in putting the patient first.
